ONE TAP 365

Product requirements & project flowcharts

Budget-conscious launch plan | Version 1.1 | 6 October 2026

Products. Services. Property assistance.

Includes commercial rules, vendor verification, recommendations, ads, payments, financial edge cases, admin workflows, acceptance criteria and four process diagrams.

Confirmed: customers use the platform free; vendors pay subscriptions to see consented customer lead details. Vendor business numbers are public. Property SIP and cash earnings remain conditional.

01 / Product brief and confirmed commercial model

One Tap 365 connects customers with nearby products, service providers and property vendors. Confirmed founder instruction: platform charges apply only to vendors. Customers pay no platform subscription, lead-access, booking or property-assistance fee. Version 1.1, 6 October 2026, supersedes the earlier customer-paid assumptions.

Customer access. Customers browse, search, save, view vendor phone numbers and send enquiries free. Phone numbers appear on eligible listings, vendor profiles, service pages and property pages. A vendor subscription is never required for a customer to call that vendor.

Vendor monetization. Vendors pay for listing capacity, customer lead-detail access, premium promotion and an optional property-manager package. The free vendor tier retains one active product listing and receives a masked lead inbox.

Meaning of free. The platform itself is free for customers. The actual goods, services or property still have their agreed purchase price, settled directly with the vendor in the recommended launch. This does not imply free products or free service delivery.

Lead access boundary. An active vendor subscription unlocks only enquiries addressed to that vendor or explicitly shared with that vendor by the customer. It does not expose the customer database, passive visitors, saved-item users or unrelated requirements.

Recommended launch. One Flutter customer/vendor app, Android first, and one responsive web admin panel with a restricted property-manager role. Products, services and property operate as contact/enquiry journeys. No customer checkout in this baseline.

Conditional modules. Actual property SIP collection remains undefined and separate. Withdrawable vendor earnings remain conditional because off-platform transactions do not create app-held funds. Razorpay serves eligible vendor payments, subject to platform billing rules.

Success measures. Track active vendors, free-to-paid conversion, qualified enquiries, lead-detail unlocks, response time, renewals, reported abuse and campaign enquiries. Call-button taps are contact intent, not confirmed calls or sales.

02 / Scope and priority

P0 is the recommended customer-free launch. Conditional items require an explicit business-model decision and are not automatically included in a fixed-price development quote.

Priority	Capability	Scope boundary
P0	Customer browsing and vendor contact	Always free; vendor business numbers visible
P0	OTP/password and role-based access	Sign in to submit a customer lead
P0	Product listings	One free active product; paid configurable caps
P0	Paid vendor lead access	Related, consented customer details only
P0	Services	Packages, availability, free requests and direct vendor contact
P0	Property assistance	Free customer requirements; vendor-funded manager package
P0	Ads, labels and admin grants	Fixed-duration ads and audited extra allowances
P0	Vendor payments and credits	Eligible Razorpay/store billing; non-cash promotional credits
Conditional	Cash wallet and withdrawals	Requires a real approved source of vendor earnings
Conditional	Property SIP / investment	Separate custody, ownership, legal and provider model
Later	Customer checkout and settlements	Only if explicitly requested; no platform fee to customer
Later	AI, auctions, chat, tracking, referrals	Not necessary for initial contact marketplace

03 / Accounts, contact visibility and lead access

One account may act as customer and vendor. Permissions are enforced on the server; role switching never creates a second identity.

Customer journey. Guest browsing and vendor-number viewing are free. Account verification is required to submit an enquiry or request a callback. Customers can also tap Call or copy a verified business number from eligible pages without purchasing anything.

Vendor public number. Use a verified business contact number, which may differ from the private login number. Obtain vendor agreement to public display; verify replacements before publication. Hide contact actions for suspended, removed or invalid vendors.

Enquiry consent. Before submission show: Share my name, phone number and this requirement with this vendor so they can contact me. Do not preselect consent for unrelated vendors or advertising. Customer may withdraw future access, block the vendor or report misuse.

Free vendor view. Show lead count, category, coarse locality, time and a safely structured requirement summary. Mask name and phone. Never return protected fields to the client, notifications, analytics, exports or URLs. Do not expose free-text or attachments that contain contact details in the masked preview.

Subscribed vendor view. Active paid vendor subscription unlocks name, phone, optional customer-shared email and the relevant enquiry. Exact address is shared separately only when the customer agrees it is needed for a visit. Identity documents, passwords and unrelated history are never included.

Lead scope and expiry. Proposed baseline: access to that vendor’s consented leads while the subscription is active and within a 90-day operational lead window. Expiry or suspension remasks details immediately, including previously opened leads. Renewal restores eligible unwithdrawn leads. Final retention period needs business/privacy approval.

Login and recovery. First signup: phone → OTP → password → terms/privacy notice. Subsequent password login; OTP for recovery and sensitive changes. Rate-limit OTP and logins, hash passwords, revoke reset sessions and require admin MFA.

Staff access. Moderators review content, finance handles vendor payments, managers see assigned customer-consented property cases, and support handles complaints. Manager authority is assignment-based, not a blanket vendor subscription bypass. Audit lead access and staff actions.

04 / Vendor verification and trust

The requested image-based Aadhaar check must be described accurately: an uploaded image reviewed by staff is not UIDAI authentication and does not prove ownership of products or property. [S1]

Submission. Explain the purpose and obtain consent before document collection. Offer a lawful alternative identity route. Prefer supported signed QR/offline verification over storing full Aadhaar images; finalize the permitted verification method before building uploads.

Review workflow. Not submitted → submitted → under review → approved / changes requested / rejected. Show clear rejection reasons and allow resubmission. A suspended vendor cannot publish, buy boosts or withdraw until reviewed.

Document protection. Never put identity images in public media storage, logs or analytics. Mask identifiers, restrict access to trained reviewers, use short-lived access links and log document access. Define minimum retention and deletion with counsel/provider; do not keep raw identity images indefinitely.

Separate checks. Identity approval, bank account validation, service qualifications and property authority are different statuses. A verified badge must explain which check occurred. Recheck payout details after changes; hold new payouts during a proposed 24-hour review period.

Property evidence. Collect owner/broker type, authority to list, locality, price, area/unit, property type and relevant project/agent registration details where applicable. Title and legal due diligence are separately contracted professional work. [S8]

Abuse handling. Report listing/vendor, block contact, prohibited-category policy, duplicate-listing review and takedown appeal are required. Moderators can pause content without deleting payment or complaint history.

05 / Product listings and plan rules

The baseline interprets “only one free product” as one concurrently active product listing, not one lifetime listing. Confirm this commercial choice before development.

Offer	Proposed entitlement	Commercial decision
Free	1 active product; masked leads; no boosts	No fee
Basic	N active products + eligible customer lead access	Price and N not yet approved
Premium	M products + lead access + B boost-days	Define boost placement and consumption
Property Assist	One vendor-funded case for 30 days	Vendor pays; customer access free
Admin grant	Extra slots / boost-days / extension	Reason, quantity, start, expiry and audit required

Listing fields. Title, category/subcategory, price, negotiable flag, condition, description, 1–8 compressed images, locality, approximate location, contact preference and availability. Category-specific fields are configured only for launch categories.

Listing lifecycle. Draft → pending moderation → active → sold / expired / paused / removed. Rejected submissions return with reasons. Drafts do not consume capacity; pending submissions reserve capacity; active listings consume capacity. Sold, removed and expired listings release it.

Quota enforcement. Effective cap = current plan cap + unexpired admin grants. Reserve and publish atomically on the server, including simultaneous submissions. Paid caps replace the free cap, rather than adding to it. A paused listing must pass the current cap when reactivated.

Expiry and downgrade. Proposed listing life: 30 days, renewable within entitlement. Subscription expiry leaves one seller-selected free listing active; absent selection retain the oldest active eligible listing and pause the rest. Never delete excess listings. Paid ad commitments have independent end dates but require an active eligible listing.

Reuse and abuse. Selling a product releases its slot. Repeated delete-and-repost attempts must not continuously reset ranking; retain original creation age and use duplicate checks/rate limits. Material edits such as category, ownership, images or misleading price trigger re-review.

Plan billing. Start with manual renewal; no automatic debit unless explicitly enabled with a mandate. One paid listing plan at a time; proposed upgrade at the next renewal to avoid proration complexity. Display current cap, usage, expiry, benefits, price and applicable tax before checkout.

Lead entitlement. Free tier receives masked related enquiries. Basic/Premium include eligible lead access while active. Listing grants or boost grants alone do not unlock leads. Property-manager packages must explicitly define lead access rather than inherit it accidentally.

06 / Discovery, location and interest ranking

A simple deterministic ranking system is adequate for the pilot and is easier to debug than machine learning. The following ranking rules are proposed product decisions.

Eligibility first. Only active, approved listings from allowed vendors in the selected market qualify. Apply category, price, condition and location filters before ranking. Services require actual serviceability, not just a nearby office.

Location. Ask for foreground location permission or allow city/pincode entry. Never block browsing if permission is denied. Offer a default 10 km radius with explicit expansion to 25/50 km. Show when results are expanded; property searches use the buyer-selected locality.

Interest signals. Use explicitly selected interests, recent category searches, saved items and detail views with limited retention. Weight saves higher than views; decay old behavior. Offer reset interests and a non-personalized recent/nearby sort. Do not infer sensitive traits.

Organic score. Illustrative normalized score: 40% category/interest match + 35% distance + 15% recency + 10% listing completeness. With no history use distance, recency and selected interests. Sort tie-breaker is stable listing ID; avoid showing the same item twice.

Paid placements. Keep sponsored slots separate from organic score. Proposed density: one clearly marked sponsored item per eight organic items, maximum two near the top. Same category/location eligibility applies. A boost buys eligible placement rotation, not a guaranteed sale or permanent first position.

Cold start and no results. New users see categories and recent nearby stock. New vendors are not buried for lacking reviews. Empty states offer radius/category changes, not fake stock. Provide “Why shown” text such as nearby, saved category or sponsored.

Privacy boundary. Show approximate distance/locality on public products and properties. Reveal service addresses only to the accepted provider at the appropriate service request stage.

07 / Services: free customer request model

The launch service section is a discovery and request marketplace. Customers pay no platform booking or subscription fee. Any actual service price is agreed and paid directly to the provider.

Provider setup. Approved vendors publish service categories, package or indicative prices, inclusions/exclusions, serviceable areas, working hours and available slots. Display whether a price is fixed or an estimate.

Customer journey. Browse service → view details and vendor phone → call directly, or sign in and submit a free request with desired time, approximate area and consent to contact sharing.

Vendor response. A free vendor sees a masked request and a Subscribe to view customer details action. An active subscribed vendor sees the related customer details and may accept, decline or propose another time. No automatic disclosure through push, email or export.

Customer expectations. Before submission state that a callback depends on provider access and availability, and offer the public Call button. No response is guaranteed merely because a request was submitted.

Request lifecycle. Submitted → awaiting provider response → proposed / accepted → completed / cancelled / expired. Proposed timeout is 24 hours, after which the customer may contact another provider. Completion is a reported outcome, not payment verification.

Scheduling. Accepted slots must not overlap for the same provider. Share exact service address only with customer permission after agreement. On subscription expiry do not leak contact details through accepted requests; alert affected parties and keep the vendor’s public number available to the customer.

Disputes and reviews. Allow cancellation, report/block and support tickets. Do not promise an in-app refund for money collected outside the platform. Permit a review after a recorded completed request, label it accurately, and do not call it a verified payment.

Future expansion. In-app service collection can be added later without charging customers a platform fee, but requires explicit payment, refund, settlement and wallet scope. The previous customer checkout and service-earnings flow is not part of this launch.

08 / Property assistance and investment boundary

Customers browse properties, view vendor numbers and submit requirements free. Property-manager subscriptions are vendor-side packages; the earlier customer-paid assistance package is removed.

Customer journey. Select buy or sell, locality, budget/asking price, property type and timeline. View public property-vendor contact details or consent to share an enquiry with the selected vendor. A person listing a property acts as a vendor for listing-plan rules.

Vendor Property Assist package. A property vendor may subscribe for manager support with their listings, lead follow-up, matching, visit coordination and case updates. Proposed package: 30 days and one active vendor case; quantities and price are not yet approved. Lead-access entitlement must be explicitly included in the package configuration.

Free customer assistance. A customer requesting platform help is not sent to checkout. Route the request to an available assigned manager or a suitable participating vendor, with clear customer consent before sharing details. If no coverage exists, offer direct browsing/contact or a waitlist.

Manager workflow. Vendor purchases package → capacity check / activation → manager assigned → requirements and authority checks → shortlist or listing preparation → visits → negotiations → external closure. Customer visits and updates carry no platform charge.

Package boundaries. No guaranteed buyer, purchase, price, legal title or investment return. Set staff working hours, contact/visit allowance, start/end dates and vendor refund rules before selling the package. If no manager is available, do not activate and consume a paid service period.

Data boundary. A paid property vendor can access only leads addressed to them or explicitly shared with them. Subscription does not unlock every property seeker. Assigned staff access is limited to the case and logged.

Property investment still unresolved. Instalments toward a named property and pooled/fractional investment are different structures. Keep SIP collection out of launch until ownership, custody, disclosures, exits and provider/legal requirements are defined. SEBI’s REIT framework may be relevant depending on the structure. [S2]

No customer fee versus purchase price. Free platform access does not make property free. Property consideration and any investment principal are separate from platform subscription charges. Do not deduct hidden platform fees from a customer’s budget.

09 / Advertising and admin labels

Use fixed-duration advertising packages and a small placement registry. Avoid auction/CPC billing in the first release.

Placement key	Audience / allowed context	Example
HOME_HERO	Selected city and active dates	Local launch campaign
PRODUCT_FEED_SPONSORED	Matching category and radius	Promoted used electronics
PRODUCT_DETAIL_RELATED	Matching product category	Relevant accessory offer
SERVICE_CATEGORY_BANNER	Service type and serviceable city	Cleaning package
PROPERTY_FEED_BANNER	Property section and locality	Disclosed housing-loan advertisement
PROPERTY_DETAIL_BANNER	Property context only	Approved lender enquiry
PROPERTY_MANAGER_PROMO	Property assistance pages	Manager package explanation

Campaign fields. Advertiser, creative, title, CTA, destination, section/placement, category, city/radius, start/end dates, priority, daily display cap, status and approver. Preview before publish; validate safe URLs and internal deep links.

Delivery rules. Apply eligibility → approved active campaigns → contractual inventory priority → fair rotation → frequency cap. Prevent incompatible campaigns from overselling exclusive slots. If no eligible campaign exists, collapse the slot.

Vendor boosts. Only approved active listings can be boosted. Start paid duration when approval and delivery eligibility begin. Pause for platform-caused interruption with extension or refund per policy; sold listings stop ads. Explain the refund policy for voluntary early cancellation before purchase.

Admin banners. Admin may upload direct-sold ads without vendor self-service. Clearly mark advertising; do not use identity data for targeting. Loan adverts must identify the advertiser and approved destination; no in-app loan origination or credit assessment at launch.

Labels. Admin defines label text, color, eligible categories, priority and expiry. “New” must specify new item condition versus recently listed. “Top rated” requires objective verified service-review criteria; otherwise disable. “365 Recommended” needs published editorial criteria; paid placement remains “Sponsored”.

Measurement. Show delivered impressions, unique clicks and enquiries with basic bot/self-click filtering. Metrics are indicative campaign reporting, not billable click totals in this fixed-duration model.

10 / Vendor payments, credits and conditional withdrawals

Only vendors buy platform subscriptions, listing upgrades, advertising and manager packages. There is no customer payment screen in the recommended launch.

Payment purposes. Maintain separate vendor order types for listing/lead-access plans, boosts, property-manager packages and any permitted promotional-credit purchase. Display price, taxes, duration, lead entitlement and refund terms before payment.

Razorpay and store billing. Use Razorpay for eligible vendor transactions. Digital in-app subscriptions and boosts still require platform-specific billing review; being paid by a vendor does not remove digital-purchase rules. Credits must not bypass a required payment channel. [S4, S5]

Activation. Create orders server-side and activate benefits only after verified provider confirmation. Check account, amount, currency and payment purpose. Handle duplicate/out-of-order events idempotently and reconcile. Client success alone never unlocks customer data. [S6]

Subscriptions. Proposed baseline: manual renewal, one active vendor listing/lead plan, clearly defined validity. Premium adds advertising allowances. A property-manager add-on must declare whether base lead access is included or a separate active plan is required.

Promotional credits. Admin-granted bonuses and purchased platform credits, if enabled, are separately recorded and non-withdrawable. Use them only for eligible vendor charges on permitted channels; never turn a bonus into cash. Refund eligible purchases to the original payment source.

Withdrawal dependency. Direct product/property/service payments do not create app-held vendor earnings. Therefore cash withdrawal stays disabled in the launch baseline. The original requested withdrawal module is conditional, not funded by subscription purchases or arbitrary admin credits.

If cash earnings are added. Define the earning transaction, collection provider, refunds, chargebacks and release conditions first. Then use pending/available/reserved balances, atomic withdrawal reservation, bank review and provider-confirmed payout. An unknown payout remains reserved until reconciled. [S3, S7]

Ledger and audit. Keep immutable transaction records in integer paise, explicit reversals and source IDs. Admin grants change benefits, not real bank money. Staff must not edit cash balances without an authorized source transaction and audit trail.

11 / Admin operations and data model

A single backend and shared business rules keep the app and admin panel consistent. Server-side checks must enforce every financial and entitlement rule.

Admin modules. Dashboard; users/roles; vendor verification; categories; listings/packages/properties; service requests; property cases; plans/grants; campaign placements; labels; payment/refund/payout queues; reports/complaints; policy content and audit logs.

Extra benefit requests. Vendor requests listing slots, boost-days or extension with reason. Admin accepts/rejects; accepted grants record type, quantity, scope, start/expiry, reviewer and request ID. Revoke only unused benefits or follow a documented correction policy. Never silently edit the base plan.

Configuration limits. Admin can configure catalog values, prices, caps and placements, not arbitrary application code. Version plans so changing a price does not change an already-paid contract. Preview customer-visible changes before activation.

Architecture recommendation. Flutter app; responsive web admin; a modular backend; relational database with geospatial lookup; private document storage separate from public images; background jobs for expiry, reminders and reconciliation. Start as a modular monolith rather than microservices.

Core entities. User, role, vendor profile, verification case, address/service area, category, listing, property detail, service package, slot, service request, enquiry, review, plan version, subscription, entitlement grant, campaign, placement, label, property case, payment, ledger entry, withdrawal, refund, complaint and audit event.

Ownership and relations. Each listing/package belongs to one vendor; each service request links customer, provider and package snapshot; each payment links exactly one payable purpose. Ledger entries retain their source payment/job; campaigns reference an approved asset; grants reference the approving admin.

Operations. Separate production/test credentials; backups with restore drill; monitoring for checkout, OTP, publication and payout failures; staff queues with overdue alerts. Keep sensitive fields out of analytics and notification text.

12 / Edge cases and acceptance scenarios

Test privacy and subscription access as core monetization behavior, alongside listing and payment reliability.

Scenario	Required behavior
Customer uses any core journey	No subscription, lead-access, booking or assistance paywall
Vendor is on free tier	Public business phone remains visible to customers
Customer only views or saves listing	No identifiable lead is created for the vendor
Customer calls vendor directly	No automatic lead identity capture; caller may reveal number outside app
Free vendor opens API / notification / export	Protected lead details are absent, not just visually blurred
Contact details typed into enquiry text	Masked preview uses safe structured fields only
Paid vendor requests another vendor’s lead	Server denies access despite active subscription
Customer withdraws consent or blocks vendor	Stop further access/contact permissions; retain only justified audit data
Subscription expires while screen is open	Revalidate on access/refresh, clear protected cached details
Vendor already copied number before expiry	Cannot recall external copies; apply terms/reporting, do not promise erasure
Subscription purchase is pending / fails	Keep lead details locked until confirmed activation
Payment callback duplicates / arrives late	Exactly-once benefit activation and correct start/expiry
Two listings with one slot remaining	Only one pending/active reservation succeeds
User demands refund for direct cash deal	Explain off-platform payment; support complaint, do not promise gateway refund
Manager package bought but no capacity	Do not consume period; resolve or refund the vendor
Vendor publishes invalid or changed phone	Require verification; remove invalid contact action
Vendor asks to cash out bonus/top-up	Deny; credits are not eligible cash earnings
No subscribed provider responds	Customer can still see/call public vendors free
Admin grants extra listings or ads	No lead-access bypass unless a separate audited subscription entitlement is granted

13 / Screen inventory and work packages

Reuse a single customer/vendor app. Customer and vendor payment permissions must be separate.

Surface	Screen families
Customer	Guest home; OTP/password; nearby search/filter; product/service/property detail with vendor phone; vendor profile; saves; free enquiry/consent; request status; free property requirements; help/privacy
Vendor	Verification; listings; services/availability; masked/unlocked lead inbox; lead details; subscriptions; promotions; manager package/case; credits/transactions; extra-benefit requests
Admin / manager	Moderation; plan/entitlement configuration; campaigns/labels; assigned cases; vendor payments/refunds; grants; complaints; lead-access audit; conditional payout controls

WP1: foundation. Finalize lead consent, entitlements, plan limits, public phone placement and platform billing. Build auth, roles and reusable layouts.

WP2: discovery and enquiries. Listings, vendor verification, nearby/interest feed, public business contacts, free structured enquiries and owner-scoped leads.

WP3: vendor monetization. Masked inbox, subscription activation/expiry, paid lead access, listing caps, boosts, banner placements, grants and payment reconciliation.

WP4: service and property workflows. Free service requests, availability, vendor-funded manager cases, consent-based assignment and progress tracking.

WP5: release. Test data leakage, expired subscriptions, concurrency, payment callbacks, moderation and real staff workflows. Pilot in one city.

Budget control. Omit customer checkout, service settlement, separate manager app, cash wallet and actual SIP collection from the baseline estimate. Quote conditional modules separately. No customer-paywall feature may be introduced through a later work package.

14 / Acceptance gates and operating readiness

The following gates enforce the founder’s corrected commercial model.

Customer-free gate. A guest can browse and view an approved vendor business number. A verified customer can send an enquiry and request property assistance without checkout. No customer subscription SKU, platform booking fee or assistance fee exists.

Paid-lead gate. A free vendor sees a masked lead. The correct active subscribed vendor sees only consented lead fields. A different subscribed vendor is denied. Expiry, suspension or consent withdrawal removes further access server-side.

Leakage gate. Test network payloads, list previews, notification text, emailed alerts, downloadable reports, search indexes and mobile caches. Private data must never be delivered to an unauthorized vendor merely because it is hidden in the UI.

Listing and ad gate. One free active product works; a second reserved/active listing is blocked. Upgrades activate once. Sold/removed listings stop being promoted. Paid ads cannot buy identity verification or misleading quality labels.

Payment and credits gate. Vendor checkout survives disconnect, duplicate/out-of-order callback and refund. Customer requests never create payable orders. Credit balances cannot be withdrawn or transferred as cash.

Property and service gate. Service requests are free; direct-contact paths remain available when a vendor has no subscription. Vendor manager packages respect staff capacity and promised duration. Customer details are shared with assigned parties only under the stated permission.

Security and performance. Admin MFA, private identity files, scoped staff roles, document-access logs and backup restore are required. Proposed pilot targets: feed usable within 3 seconds on agreed Android/4G conditions; ordinary read API p95 under 800 ms, excluding outside providers.

Operating policies. Publish vendor subscription benefits, lead-access limitations, refund rules, public phone terms, consent/retention rules and complaint process. Recheck applicable privacy, real-estate, tax and platform requirements for launch. [S8, S9]

Costs. Budget for OTP, hosting/media, geocoding, payment/store fees, verification, moderators, support and property managers. Vendor subscription revenue must cover these operating costs; customers are not charged platform fees.

15 / Confirmed decisions and remaining choices

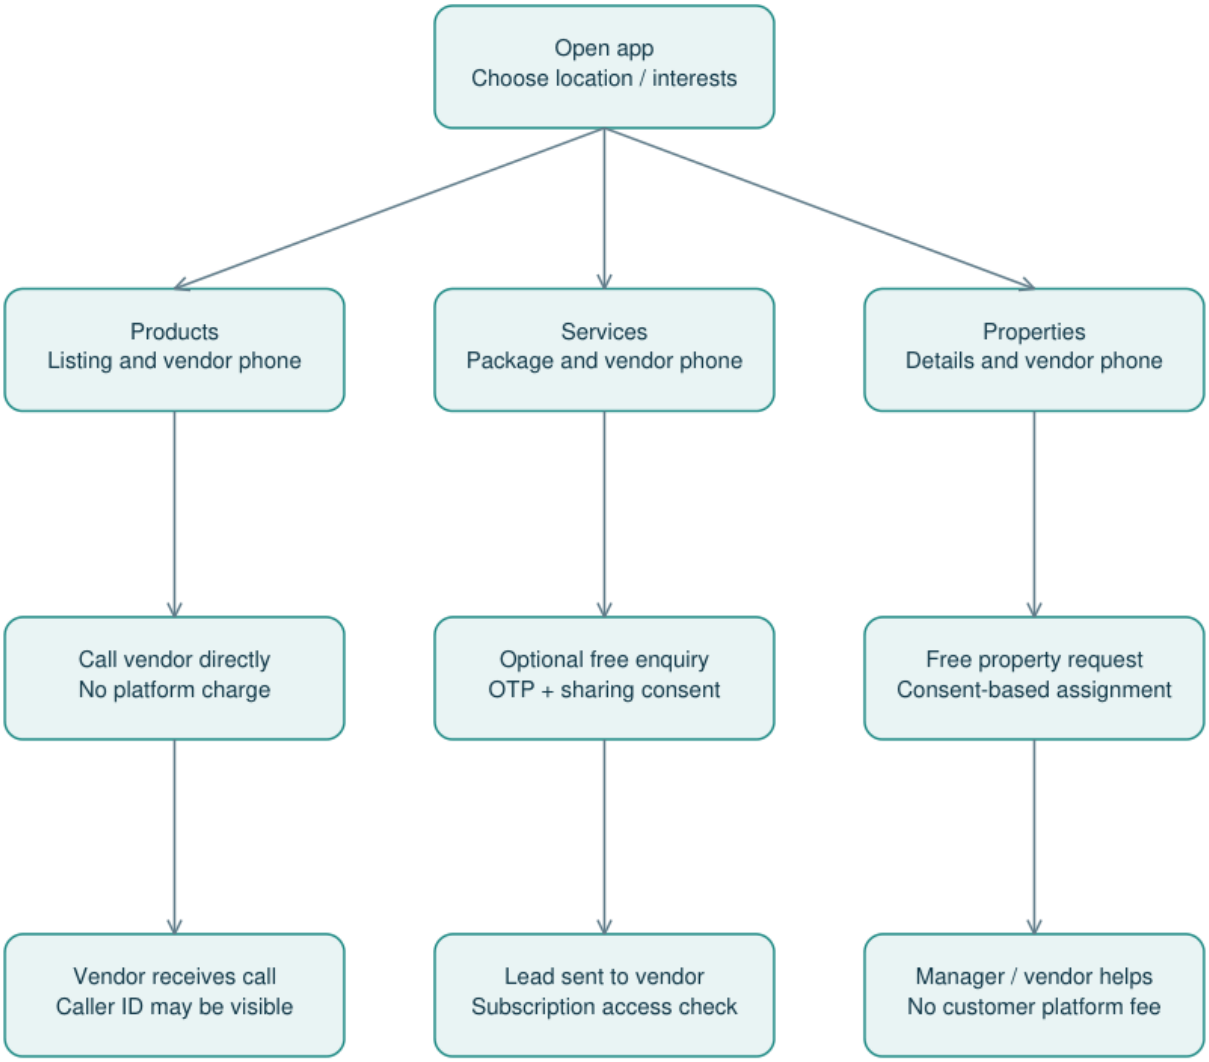

The customer-free/vendor-paid model is confirmed. The remaining values below are proposed defaults for a development estimate.

Decision	Baseline	Status
Who pays platform charges?	Vendors only	Confirmed
Can customers see vendor numbers?	Yes: listing, service/property detail and vendor profile	Confirmed
Can free vendors see customer details?	No; active subscription required	Confirmed
Which customers are visible?	Own or explicitly consent-shared leads only	Proposed privacy boundary
Free vendor product allowance	One concurrent active product	Prior baseline
Lead allowance	All eligible own leads during active subscription; no per-lead fee	Proposed; price/caps to confirm
Lead access window	90 days; remask at expiry or permission withdrawal	Proposed
Property manager payer	Property vendor; customers pay no platform fee	Updated to match instruction
Direct transaction prices	Buyer pays vendor for actual goods/services/property	Interpretation of free platform access
Cash withdrawal	Disabled until legitimate in-app earnings source exists	Conditional scope
SIP meaning	Named-property instalments versus pooled investment	Still unresolved
Launch	Android, one city, web admin/manager access	Proposed

Commercial limitation. When a customer directly calls a public vendor number, the vendor may see caller ID without subscribing. The app can gate its lead inbox, not normal telephone caller ID. Hiding or relaying numbers would conflict with visible-number simplicity and add cost; it is not included.

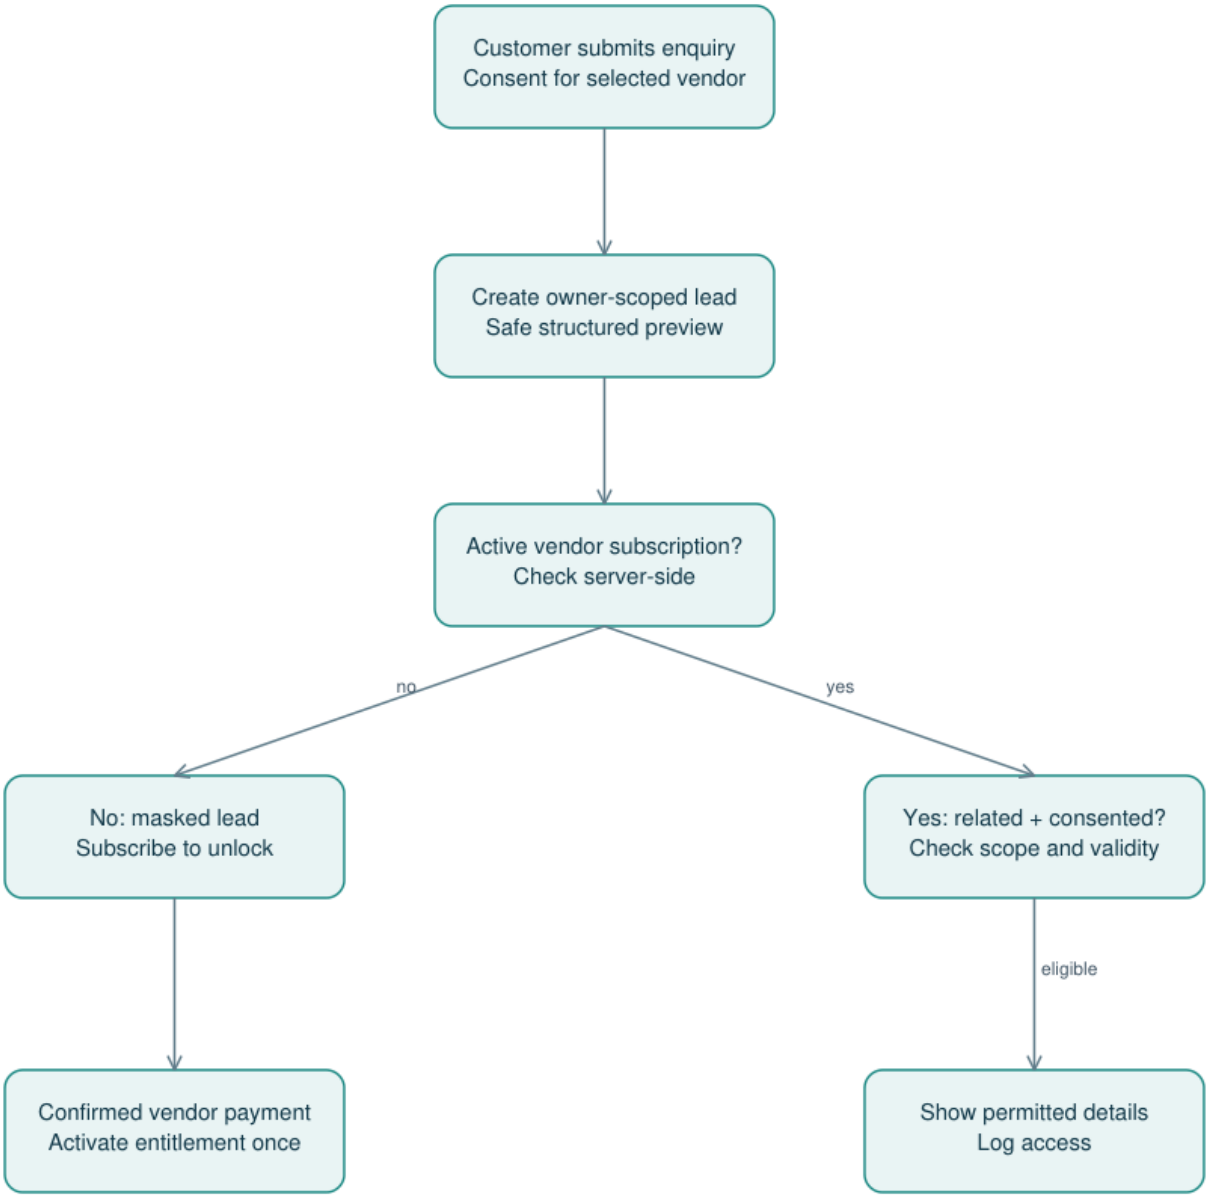

Essential additions only. Structured lead consent, server-side masking, block/report, verified business numbers, subscription expiry handling, payment reconciliation and audit logs are essential. No expensive call-masking, AI recommendation engine or customer payment module is added.

Flow 1 / Free customer contact journeys

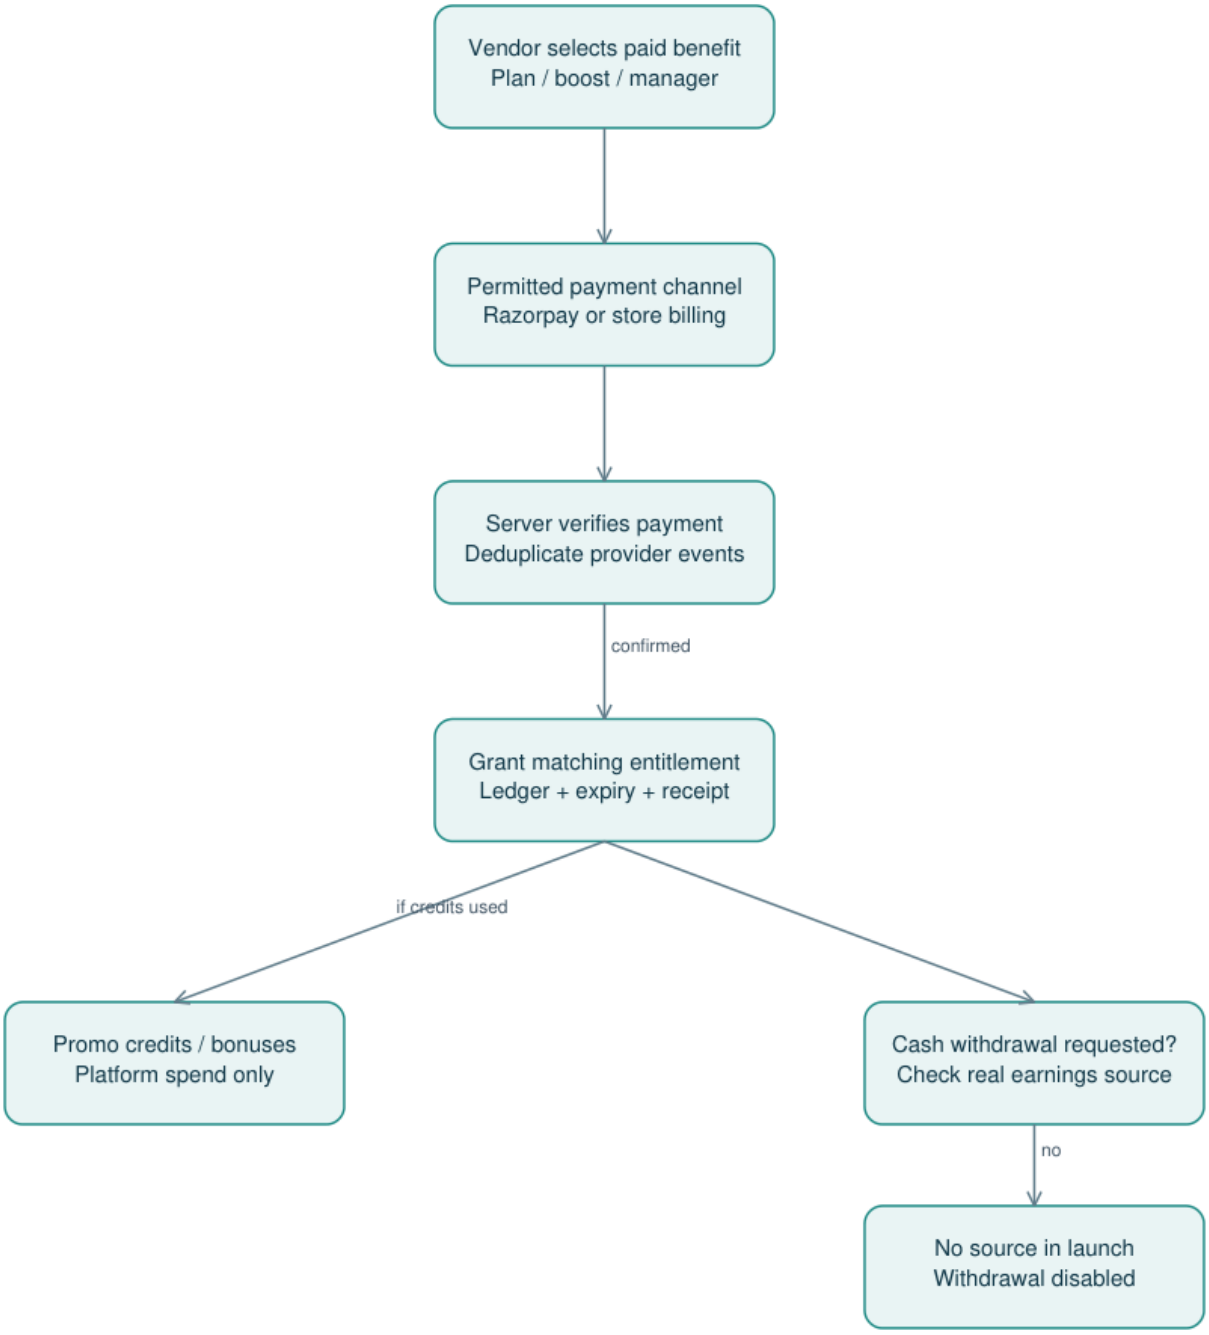

All verticals offer public vendor contact and free enquiries.
Actual goods/services/property prices are settled directly with the vendor.

Flow 2 / Vendor subscription and lead access

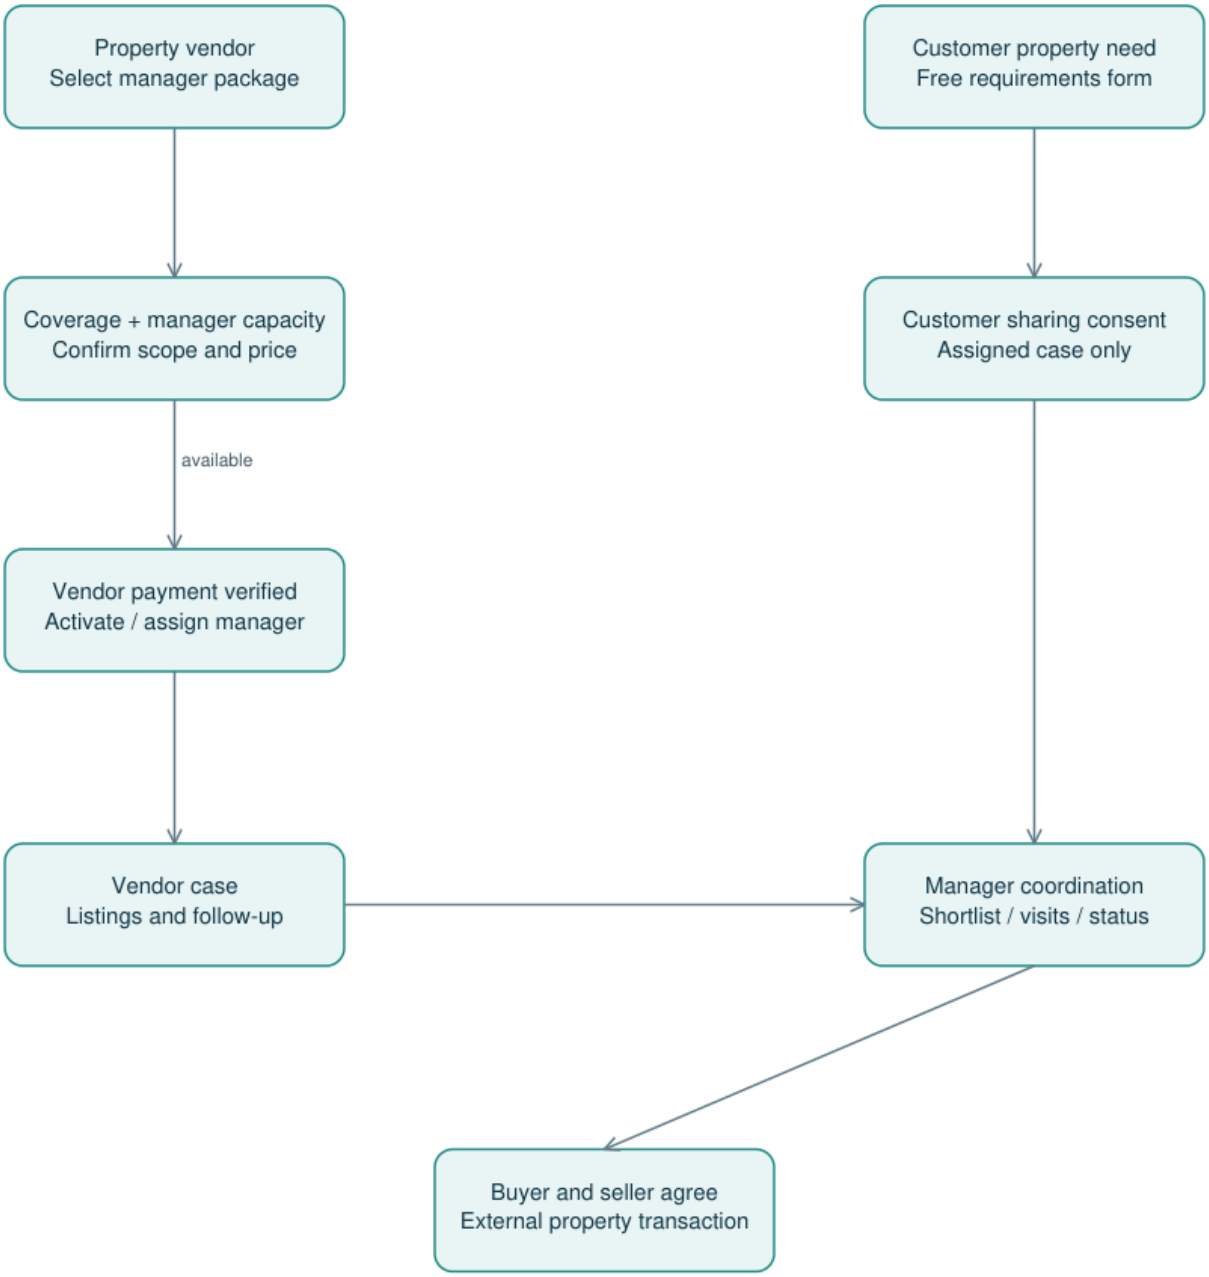

Payment confirmation triggers a fresh access check; it never unlocks unrelated leads.
Expiry, suspension or withdrawn consent remasks details. Passive views are not leads.

Flow 3 / Vendor payments and wallet boundary

No customer checkout in the launch model. External deals create no app-held funds.
Future cash earnings and withdrawals require a separately approved payment scope.

Flow 4 / Vendor-funded property assistance

Customers pay no platform assistance fee. Vendors fund manager packages.
Actual property SIP remains a separate undefined investment workstream.

Sources and research boundaries

Official sources consulted on 6 October 2026. Requirements above are proposed product decisions unless explicitly attributed. Regulations, provider approval and store policies must be rechecked against the final business model before release. No investment return or regulatory approval is assumed.
